

PRODUCT DATA SHEET

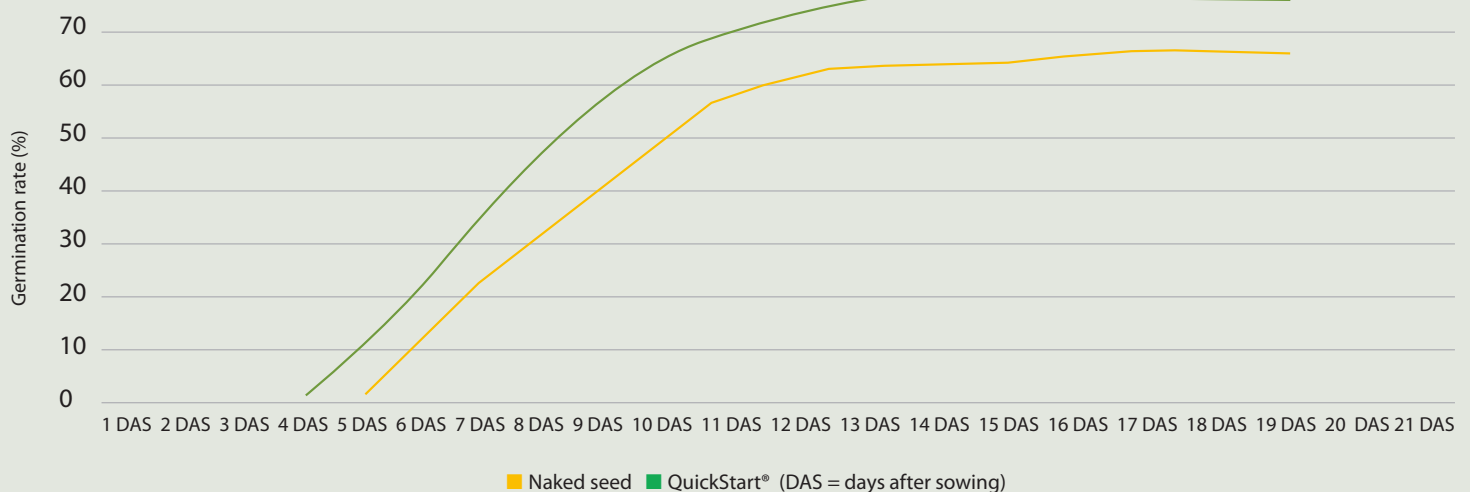

For a fast start

The QuickStart® process is a treatment using a revitalizing, non-microbial plant-strengthening complex. All ingredients added during the seed treatment are approved for organic use and are suitable for application in organic farming. Through the gentle film-coating treatment the components can be placed directly on the seed without significantly increasing the thousand-kernel weight. Treatment with QuickStart® offers the advantage of faster germination and, as a result, improved establishment. In addition to the plant-strengthening complex, a dye can be added to provide even better visual control.

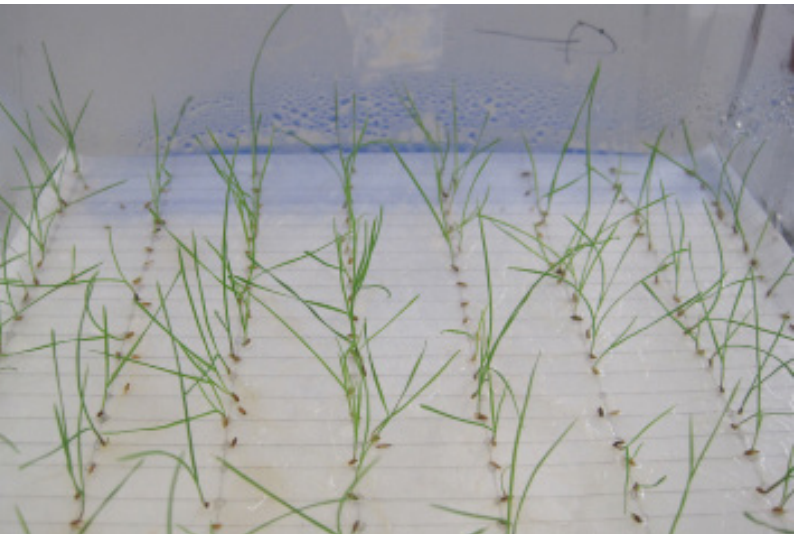

*Optional:
with dye
for improved
visual control!*

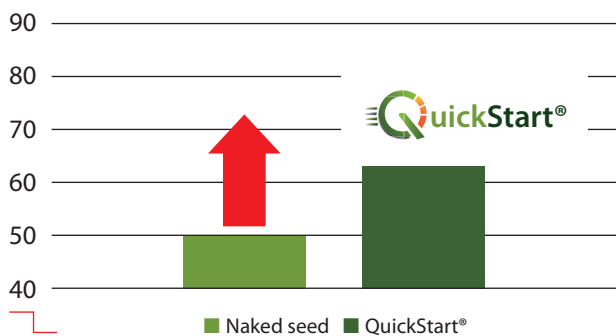

Ø Germination rate (%) of Kentucky bluegrass (*Poa pratensis*)
Naked seed vs. film coating with QuickStart®

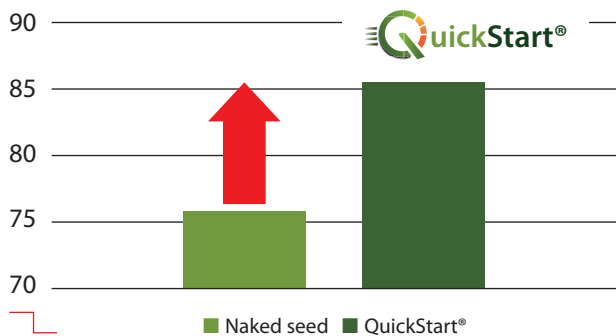

PRODUCT DATA SHEET

**Germination rate (%) of Kentucky bluegrass
10 DAS (days after sowing)**

**Germination rate (%) of Kentucky bluegrass
21 DAS (days after sowing)**

Benefits

- new plant-strengthening complex
- effective acceleration of germination
- visual control through coloring
- increased competitive ability
- improved establishment
- vigorous, deep-green seedlings
- suitable for organic farming
- increased resilience
- promotes root growth and nutrient uptake
- rapid early development
