

Variety Description

Variety

SEVERKA

Species	White mustard
Botanical name	Sinapis alba
Ploidy	2
Seeding rate	25–30 kg/ha as catch crop
Distance between rows	as cereals
Sowing period	from July to late August
Sowing depth	2–3 cm

Agronomic figures*:

Susceptibility to beet cyst nematodes	-
Development after sowing	7
Inclination to flower	9
Tendency to lodging	3

Clarification of figures*:

1: very early, very low / 5: medium / 9: very late, very high

Variety description

SEVERKA is our conventional white mustard variety and is categorised in the early maturity group. Owing to its rapid mass formation after sowing, SEVERKA protects the soil against water and wind erosion and at the same time prevents weed growth. Furthermore, it improves soil fertility by enriching it with organic matter. SEVERKA is extremely stable. This, combined with its tendency to quickly die out in winter, makes ZLATA an ideal component in mulch sowing systems.

Most important characteristics

Conventional variety with ideal properties
Extremely high mass formation after sowing
Excellent weed suppression
Low tendency to lodging due to high stability
Winterkilled

Usage
