

Variety Description

Variety

BAMBERKA

Species	White mustard
Botanical name	Sinapis alba
Ploidy	diploid
Seeding rate	20-25 kg/ha as catch crop
Distance between rows	as cereals
Sowing period	from late July to late August
Sowing depth	2-3 cm

Agronomic figures*:

Vulnerability to Beet nematodes	-
Development after sowing	6
Inclination to flower	5
Tendency to lodging	5

Clarification of figures*:

1: very early, very low / 5: medium / 9: very late, very high

* **Source:** Cultivator classification

Variety description

BAMBERKA is a top conventional variety. It covers the ground quickly, protecting the soil against water and wind erosion, as well as regulating weed growth. Apart from that, BAMBERKA promotes soil fertility by enriching it with organic matter. It is able to assimilate considerable amounts of nitrogen and store it in the aerial parts of the plant. The stored nitrogen can be absorbed again by the plants in the following year, meaning it does not leach into areas away from the roots.

Most important characteristics

Good stability
High mass formation after sowing
Good weed suppression
Winterkilled
